

Relieving pain from Endometriosis

Are you living with the debilitating condition of Endometriosis?

Is there an alternative to relying on potentially harmful drugs?

Yes, the **Oska Pulse**.

Introducing the **Oska Pulse** PEMF medical device.

Oska Pulse produces specially designed pre-programmed pulsed electromagnetic fields delivered in four separate stages. Each stage consists of treatment protocols designed to relieve the debilitating pain associated with Endometriosis.

Endometriosis

Endometriosis is a disorder in which tissue usually lining the uterus grows outside it. The most common symptoms are pelvic pain, period pain, cramps, and menstrual irregularity.

It is estimated that Endometriosis affects 1 in 7 females, the majority between the ages of 14 and 44. There are currently over 830,000 in Australia and approximately 200 million worldwide!

Typical treatment of pain from endometriosis:

NSAIDs, or non-steroidal anti-inflammatory medicines like ibuprofen, Motrin, and Tylenol, are commonly prescribed by doctors. However, severe symptoms that do not respond to medication may require extensive surgery such as a hysterectomy (removal of the uterus, cervix, and fallopian tubes). For cases where surgery is needed, the Oska Pulse aids with speeding the healing process and recovery time.

Endometriosis and Pulsed Electromagnetic Field Therapy (PEMFT)

Pulsed Electromagnetic Field Therapy, or PEMFT, has been recognised for over 70 years as a drug-free alternative for treating inflammation and relieving pain. Whilst inflammation is an essential part of the body's natural healing processes, once it becomes chronic, as with Endometriosis, the pain becomes unbearable.

By restoring the natural electrical balance at the cellular level, PEMF may reduce period pain, pelvic pain, or pain from cramping.

With increased awareness of the side effects of long-term prescription medication, PEMF Therapy has finally been recognised as an excellent way to treat Endometriosis and possibly the most cost-effective.

PEMF has many health benefits that make it an effective treatment option, as it can be used alone or, if necessary, alongside traditional treatment modalities.

Some advantages of Oska Pulse

- Pre-programmed, auto turn off (*just press button to turn on, rechargeable battery*).
- Non-invasive drug-free treatment (*does not vibrate or create any sensation*).
- No sticky pads or wires to attach (*wear anywhere, any time*).
- Fully portable, does not impede regular activities, can be worn over clothing.

Whilst not a cure, the pulsed energy generated is known to help end the vicious cycle of emotional distress and physical pain. Registered in Australia by the Therapeutic Goods Administration (TGA) and in Europe CE approved as a Class 2a Medical Device, **Oska Pulse** is a safe and convenient alternative for the many women suffering from Endometriosis.
